Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This anti-idiotype antibody is used to delay the development of, or treat, a human milk fat globule (HMFG) associated tumour in an individual having low tumour burden. The antibody 11D10 is used to prevent the recurrence of HMFG-associated tumours e.g. ovarian, non-small cell lung and pancreatic carcinoma,

                                                                                                                                                                                                                                     This cDNA sequence encodes the heavy chain variable region VH (AAWB5150) of monoclonal anti-idiotype antibody 11D10 produced by hybridoma cell line Arcc 12020. 11D10 was obtained by immunising naive mice with Mc-10 anti-HWFG antibody to obtain an anti-idiotype response. It elicits an immune response against a specific epitope of a high mol. Wt. mucin of human milk fait globule (HWFG). It induces an immunological response to HWFG in mice, rabbits, monkeys and patients with advanced HWFG-associated tumours. Pharmaceutical compositions and vaccines comprising 11D10, 11D10 polypeptides and/or 11D10 polypurclectides are claimed. Also claimed are diagnostic kits and methods of using 11D10, 11D10 polypeptides and/or 11D10 polypurclectides, including methods of treating HWFG-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises a method for delaying the development of, or treating a tumour that is associated with human milk fat globules (HMFG) or carcinoembryonic antigen (CEA). The method of the invention involves administering an anti-idiotypic antibody for HMFG (e.g. 11D10), and an anti-idiotypic antibody for CEA (e.g. 3311). The method is useful for delaying the development, of or treating HMFG/CEA-associated tumours. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes the murine anti-idiotype monoclonal antibody (MAb) 1A7 variable heavy chain. MAb 1A7 was raised against the anti-ganglioside 2 (GD2) MAb 14G2a, which binds an unique epitope of GD2. As the glycosphingolipid GD2 is expressed at high density by human neuroectodermal tumours, e.g. malignant melanoma, controlled to a clina, soft tissue sarcoma and small cell carcinoma of the lung, MAb 1A7, or its cDNA can be used in a vaccine to treat or palliate such disease. They can also be used to reduce the risk of recurrence of a clinically detectable tumour, and detect an atti-GD2 Ab bound to a tumour cell.

MAb 1A7 overcomes immune tolerance and induces an immune response against GD2, which comprises anti-GD2 Ab (humoral response) and CD2-specific cells (cellular response). It can be used to purify anti-GD2 (Ab1') or 14G2a (Ab1') detect anti-1A7 or anti-GD2 in a sample or measure the level of cellular anti-1A7 or anti-GD2 activity.

The CDNA can be used in expression systems for 1A7 produ., and in the control of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monoclonal antibody; MAb; 1A7; GD2; immune response; melanoma; neuroblastoma; glioma; soft tissue carcinoma; small cell carcinoma; tumor-associated antigen; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the prepn. of probes and primers to respectively assay for 1A7 cDNA, and amplify desired polynucleotides for use in gene therapy. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

elicits an anti-GDZ (tumor-associated antigen) immunological response in humans. MAb 1A7 has defined light and heavy chain variable region sequences. The MAb 1A7 and polypeptides can be used for eliciting an anti-GDZ immune response. The polypeptides can also be used for detecting or purifying anti-GDZ antibody. The products can be used for treating GDZ associated diseases, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for palliating the disease or for reducing the risk of recurrence. The present sequence represents the CDNA encoding the heavy chain variable region of MAb 1A7.

The invention provides a method of treating of psoriasis by administering an antigen which has similar immunogenic properties to an antigen expressed on cells of psoriatic tissue so that an immunological response is elicited in the individual. The antigen stimulates the generation of anti-idiotype antibodies that neutralize the aberrant immune response causing the psoriasis. The method is used to treat psoriasis, especially chronic plaque, gluttate, pusque-type psoriasis or psoriatic arthritis. The compositions allow the individual's own immune system to act against psoriatic tissue. The present sequence represents a cDNA encoding the heavy chain variable region of monoclonal antibody 1A7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  366 TGCTCTGGACTACTGGGGTCAAGGAACCTCAGTCACCGTCTCCTCAGCCCAAAACGACACC

The polypeptide encoded by this sequence has three CDRs (complementarity determining regions). When administered to an individual the 1A7 antibody induces an immune response against ganglioside GD2. The light chain variable region of the 1A7 antibody fAX28468) is also capable of eliciting an anti GD2 response in mammals. Both the heavy and light chain variable regions of the 1A7 antibody produce anti-GD2 real and antibody responses. The peptides and antibodies may be useful for the modulation of ganglioside GD2, and particularly for the treatment of GD2-associated tumours (e.g. melanoma, neuroblastoma, glioma, soft tissue sarcoma, and small cell carcinoma (including small cell lung cancer).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence encodes a single chain sFV anti-rev antibody constructed using variable domains of the heavy and light chains of a murine monoclonal antibody against (HIV-IIIB) rev (the parent artibody). This is incorporated into a viral vector where expression of the anti-rev gene causes inhibition of the rev function and so affects replication of the other viral (HIV). Rev is one of the sesential regulatory proteins of HIV, it binds to rev responsive element (RRE) and promotes the nuclear export, stabilisation and utilisation of the viral mRNA's containing RRE. A novel gene therapy method has been produced, where a recombinant (rec) gene is introduced into the cells of a mammal. The method is improved by using a rec gene encoding an antipedy (Ab) that is selectively specific for an intracellular (IC) antipody (Ab) that is selectively specific for an intracellular (IC) antipod a sociated with a disease. The method is used to prevent or halt the progress of a disease by IC immunisation. Specifically, the Ab can be used to inhibit the replication of a virus, such as human I-cell
                                                                                                                                                   ó
                                                                                                                                                                         Improved gene therapy using recombinant gene coding for an antibody – for intracellular immunisation against pathogens recognised by the antibody, esp. human immunodeficiency virus \rm HIV-1

         The sequence given in AAQ81500 encodes an sFv anti-rev antibody consisting of the variable domains of the heavy and light chains of a mouse MAb against HIV-1 IIIB rev. The sFv specifically binds a highly conserved Rev domain. HeLa 14 cells expressing the SFv were resistant to all HIV-1 clinical isolates tested. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence encodes a fusion of an anti-CD20 single chain antibody and streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs to expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively inked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence and a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells, particularly tumour cells associated with cancer.
                                                                                                                                                                                                                                                                                                     ö

DNA encoding a fusion of a single chain antibody and streptavidin. Streptavidin; tumour cell; cancer; adenocarcinoma; AAC86591 standard; DNA; 765 BP. hematological malignancy; ss 99US-0137900. 99US-0168976. 05-JUN-2000; 2000WO-US15595. (first entry) Streptomyces avidinii. Unidentified. (NEOR-) NEORX CORP. WO200075333-A1 07-JUN-1999; 03-DEC-1999; 02-APR-2001 14-DEC-2000 Synthetic. AAC86591; RESULT 11 AAC8659

The present sequence encodes a fusion of an anti-CD20 single chain antibody and streptavidin. The fusion protein is expressed using vectors of the invention. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence. Alternatively in a connoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour constructs of the protein and protein and process. e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a target site within a mammalian host. New vector constructs for expressing genomic streptavidin fusion proteins which are useful for targeting tumour cells associated with Example 5; Page 95; 100pp; English. cancer, e.g. adenocarcinomas -WPI; 2001-091213/10.

The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 minno acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells particularly tumour cells associated with cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                purposes, e.g. for detecting the presence or absence of, or treating, a target site within a mammalian host.
                                                                                                                                                                                                                                                                                                       DNA encoding a fusion of anti-CD20 single chain antibody/streptavidin.

                                                             The present sequence encodes a fusion of an anti-CD20 single chain antibody (B9E9) streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells, particularly tumour cells associated with cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a target site within a mammalian host.
                                                                                                                                                                                                                                                                       Anti-CD20 single chain antibody/streptavidin fusion protein cassette.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes a synthetic CD20-specific chimeric receptor. The specification describes CD-20 specific redirected T cells which express and bear on the cell surface membrane a CD20-chimeric receptor comprising an intracellular signalling domain, a transmembrane domain and an extracellular domain, the extracellular domain comprising a CD20-specific receptor. The genetically engineered CD20-specific redirected T cells are useful for treating a CD20+ malignancy, such as non-Hodgkin's lymphoma or CD20+ acute or chronic leukemia, in a human patient having previously undergone myeoablative chemotherapy and stem cell rescue. The genetically, engineered CD20-specific redirected T cells are also useful for abrogating an untoward B cell function, such

```
Self-protecting chimeric polypeptide comprising biologically active sequence and single-chain antibody sequence - has resistance to e.g. disrupting temperature, presence of proteolytic enzymes, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the cDNA for the immunoglobulin (Ig) heavy chain variable region of a murine anti-asparaginase II monoclonal antibody (MAb). The CDNA was used in the preparation of a novel recombinant chimeric polypeptide, comprising a list region comprising a biologically active domain and another domain containing an epitope, linked via a polypeptide to a 2nd region including a single chain antibody (SCA) having the light and heavy chains of an antibody variable region which specifically binds the epitope in the 1st region. The chimeric polypeptide assumes a conformation in which the SCA is bound to the epitope of the 1st region and protects its biological activity from deactivation by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       denaturing temperatures or pH conditions, protectlytic enzymes, oxidising agents or alcohol. The regions of the chimeric polypeptide interact to form a structure analogous to an antibody-antigen complex. A L-asparaginase-SCA fusion protein of the above type has better trypsin resistance than free
                                                                                                                                                                                                  cDNA for Ig heavy chain variable region of anti-asparaginase MAb.
                                                                                                                                                                                                                                Immunoglobulin; Ig; heavy chain; variable region; murine;

             Sequence 3, Application US/09861294;
Patent No. US20020098190A1;
GENERAL INFORMATION:
APPLICANT: Malaya CHATTERJEE
APPLICANT: WENNEY A. FOON
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR TREATING
TITLE OF INVENTION: TUMORS BEARING HARG AND CEA ANTIGENS;
FILE REFERENCE: 304142000620;
CURRENT APPLICATION NUMBER: US/09/861,294
CURRENT FILING DATE: 1997-06-13
PRIOR APPLICATION NUMBER: 09/096,244
PRIOR APPLICATION NUMBER: 09/096,244

PRIOR APPLICATION NUMBER: 09/096,244

NUMBER OF SEQ ID NOS: 38
SOFTWARE: FASTSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 461;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Indels
